

In the Abstract:

Please substitute the following new Abstract for the old Abstract previously submitted on page 14 of the original specification:

A tool for fitting a belt into the groove of a pulley. The tool comprises a base plate having a first and a second face. The plate is flat or forms a part of a cylinder and the first face is concave. The tool also comprises first and second holding members that are substantially flat and parallel with each other. The holding members are spaced apart and extend from the first face of the base plate. If the base plate is flat, the holding members are perpendicular to the base plate. If the base plate is not flat, the holding members are perpendicular to the axis of the cylinder at least partially formed by the base plate. The tool also comprises a guide member extending from a second face of the plate opposite to the first face.
